

Cheat sheet of the most used Pandas commands

Harsh Choudhary

Cheat sheet of the most used Pandas commands

Data structures

Command	Description
<code>pd.Series(data, index=None, dtype=None)</code>	Create a 1D labeled array.
<code>pd.DataFrame(data, index=None, columns=None)</code>	Create a 2D tabular structure.
<code>pd.Categorical(values)</code>	Create a categorical dtype for efficient storage.

Import and options

Command	Description
<code>import pandas as pd</code>	Standard import alias for pandas.
<code>pd.set_option(key, value)</code>	Change display/behavior option (e.g., max rows/cols).
<code>pd.get_option(key)</code>	Read the current value of an option.
<code>pd.reset_option(key)</code>	Reset an option to its default.
<code>pd.describe_option(pattern=None)</code>	Show details about available options.
<code>pd.options</code>	Namespace object to access all options.

Input/Output (I/O)

Command	Description
<code>pd.read_csv(path, ...)</code> / <code>df.to_csv(path, ...)</code>	Read/write CSV.
<code>pd.read_excel(path, sheet_name=0)</code> / <code>df.to_excel(path)</code>	Read/write Excel sheets.
<code>pd.read_json(path_or_buf)</code> / <code>df.to_json(path)</code>	Read/write JSON.
<code>pd.read_html(source)</code> / <code>df.to_html(buf)</code>	Parse HTML tables to/from Data Frames.
<code>pd.read_sql(sql, con)</code> / <code>df.to_sql(name, con)</code>	Read from / write to SQL.
<code>pd.read_pickle(path)</code> / <code>df.to_pickle(path)</code>	Serialize/deserialize pandas objects.
<code>pd.read_feather(path)</code> / <code>df.to_feather(path)</code>	Fast Arrow Feather format.
<code>pd.read_parquet(path)</code> / <code>df.to_parquet(path)</code>	Columnar Parquet format.
<code>pd.read_orc(path)</code> / <code>df.to_orc(path)</code>	Read/write ORC files.
<code>pd.read_stata(path)</code> / <code>df.to_stata(path)</code>	Stata files.
<code>pd.read_spss(path)</code>	Import SPSS data.
<code>pd.read_sas(path)</code>	Import SAS data.
<code>pd.read_hdf(path, key=None)</code> / <code>df.to_hdf(path, key)</code>	HDF5 storage.
<code>pd.read_gbq(query, project=...)</code> / <code>df.to_gbq(...)</code>	Big Query I/O.
<code>pd.read_clipboard()</code> / <code>df.to_clipboard()</code>	Clipboard I/O.
<code>pd.read_xml(path)</code> / <code>df.to_xml(path)</code>	XML I/O.

Data inspection

Command	Description
<code>df.head(n), df.tail(n), df.sample(n)</code>	Peek at rows.
<code>df.info()</code>	Column types, non-nulls, memory.
<code>df.describe(include=None)</code>	Summary stats.
<code>df.shape, df.size, df.ndim</code>	Dimensions, elements, axes.
<code>df.dtypes</code>	Per-column dtypes.
<code>df.columns, df.index</code>	Labels of columns/rows.
<code>df.values</code>	Underlying NumPy array (discouraged for mixed dtypes).
<code>df.memory_usage(deep=True)</code>	Memory by column.
<code>df.isnull(), df.notnull()</code>	NA mask.

Selection and indexing

Command	Description
<code>df["col"], df[["c1","c2"]]</code>	Select column(s).
<code>df.loc[row_sel, col_sel]</code>	Label-based selection.
<code>df.iloc[row_sel, col_sel]</code>	Position-based selection.

<code>df.at[label_row, label_col]</code>	Fast scalar by label.
<code>df.iat[i, j]</code>	Fast scalar by position.
<code>df.filter(items=None, like=None, regex=None, axis=0/1)</code>	Filter by labels/regex.
<code>df.query("expr")</code>	SQL-like Boolean query.
<code>df.get("col", default=None)</code>	Safe column get.
<code>df.xs(key, level=None, axis=0)</code>	Cross-section on axis/level.

Cleaning missing and duplicates

Command	Description
<code>df.dropna(axis=0, how="any", subset=None)</code>	Drop NA rows/cols.
<code>df.fillna(value, method=None)</code>	Fill NA with scalar/dict/ffill/bfill.
<code>df.replace(to_replace, value=None, regex=False)</code>	Replace values/patterns.
<code>df.interpolate(method="linear")</code>	Interpolate numeric gaps.
<code>df.duplicated(subset=None, keep="first")</code>	Mark duplicate rows.
<code>df.drop_duplicates(subset=None, keep="first")</code>	Remove duplicates.

Manipulation and transformation

Command	Description
<code>df.sort_values(by, ascending=True)</code>	Sort by column(s).
<code>df.sort_index(axis=0/1)</code>	Sort by index/columns.
<code>df.rename(columns=..., index=...)</code>	Rename labels.
<code>df.set_index(keys, drop=True)</code>	Make column(s) the index.
<code>df.reset_index(drop=False)</code>	Restore index to column(s).
<code>df.drop(labels, axis=0/1)</code>	Drop rows/columns.
<code>df.insert(loc, name, values)</code>	Insert column by position.
<code>df.pop(name)</code>	Remove and return a column.
<code>df.assign(new=expr, ...)</code>	Add column(s) without mutating original.
<code>df.apply(func, axis=0/1)</code>	Apply along axis.
<code>df.applymap(func)</code>	Elementwise over Data Frame.
<code>s.map(func/dict)</code>	Map over Series.
<code>df.eval("expr")</code>	Evaluate expressions on columns.
<code>df.astype(dtype or dict)</code>	Convert dtype(s).
<code>df.clip(lower=None, upper=None)</code>	Cap values.

Grouping, aggregation, reshaping

Merge and join

Command	Description
<code>df.concat()</code>	Concatenate along axis.
<code>.join()</code>	SQL-style joins.
<code>df.pivot(index, columns, values)</code>	Long → wide (no agg).
<code>df.join(other, on=None, how="left")</code>	Index-based join or on key.
<code>df.combine_first(other)</code> <code>df.melt(id_vars, value_vars, var_name, value_name)</code>	Fill NA from another object. Wide → long.
<code>df.stack() / df.unstack(level)</code>	Rotate between index/columns.
<code>pd.crosstab(index, columns, margins=False)</code>	Frequency table.
<code>pd.cut(x, bins) / pd.qcut(x, q)</code>	Bin numeric data (equal width/quantile).

Stats and math

Command	Description
<code>df.mean(), df.median(), df.mode()</code>	Central tendency.
<code>df.min(), df.max(), df.sum()</code>	Extrema/sum.
<code>df.cumsum(), df.cumprod()</code>	Cumulative ops.
<code>df.var(), df.std()</code>	Variance/standard deviation.
<code>df.corr(), df.cov()</code>	Correlation/covariance.

<code>df.skew(), df.kurt()</code>	Skewness/kurtosis.
<code>df.rank(method="average")</code>	Ranks per column.

Time series

Command	Description
<code>pd.to_datetime(obj, format=...)</code>	Parse to datetime64.
<code>df.set_index("dt").resample("M").agg(func)</code>	Resample by time.
<code>df.asfreq("H")</code>	Set fixed frequency without aggregation.
<code>df.shift(1)</code>	Shift values by periods.
<code>df.rolling(window).agg(func)</code>	Rolling window stats.
<code>df.expanding(min_periods).agg(func)</code>	Expanding window.
<code>df.ewm(alpha=...).mean()</code>	Exponentially weighted mean.
<code>pd.date_range(start, end, freq)</code>	Build DatetimeIndex.
<code>pd.period_range(start, end, freq)</code>	Period ranges.
<code>pd.timedelta_range(start, periods, freq)</code>	Timedelta ranges.

Plotting (built-in)

Command	Description
<code>df.plot(kind="line"/"bar"/"barh"/"area"/"pie"/"scatter"/"hexbin"/"density")</code>	Quick charts from DataFrame/Series.
<code>df.hist(bins=...)</code>	Histograms per numeric column.
<code>df.boxplot()</code>	Box-and-whisker plots.

Vectorized string ops (Series.str)

Command	Description
<code>.str.lower(), .str.upper(), .str.title()</code>	Case transforms.
<code>.str.len(), .str.strip(), .str.pad()</code>	Length/trim/pad.
<code>.str.contains(pat, regex=True)</code>	Substring/regex test.
<code>.str.replace(pat, repl, regex=...)</code>	Substitute patterns.

<code>.str.split(pat, n, expand)</code>	Split to lists or columns.
<code>.str.cat(others, sep)</code>	Concatenate strings.
<code>.str.startswith(x), .str.endswith(y)</code>	Prefix/suffix checks.
<code>.str.extract(pattern), .str.findall(pattern)</code>	Regex capture/matches.

Categoricals

Command	Description
<code>s.astype("category") / pd.Categorical(vals)</code>	Convert/create categorical.
<code>s.cat.categories</code>	View categories.
<code>s.cat.codes</code>	Integer codes per category.
<code>s.cat.rename_categories(mapper)</code>	Rename categories.
<code>s.cat.reorder_categories(new_order, ordered=True)</code>	Reorder and set ordering.
<code>s.cat.add_categories(new) / s.cat.remove_categories(rem)</code>	Modify set.
<code>s.cat.remove_unused_categories()</code>	Drop unused categories.

Utilities

Command	Description
<code>pd.factorize(values)</code>	Encode labels to integers + uniques.
<code>pd.unique(values)</code>	Unique values (preserves order).
<code>pd.value_counts(values, normalize=False)</code>	Frequency counts.
<code>pd.get_dummies(df, columns=...)</code>	One-hot encoding.
<code>pd.to_numeric(obj, errors="coerce")</code>	Convert to numeric, set bad to NaN.
<code>pd.to_timedelta(obj)</code>	Convert to timedelta dtype.
